TNF-alpha (AAR38069 and AAR38077), rTNF-S-AM1 (AAR38070), rTNF-S-AM2 (AAR38071), thymosin beta4-TNF fused cpd. (AAR38072-76).

The drugs are effective in treatment of withdrawal symptoms caused by habitual use of alcohol, morphine narcotics or nicotine in humans or animals (e.g. swine, dog, cat, chicken). The drugs may be administered as TNF at a dose of 10ng-10mg orally or 5ng-1mg i.v. or 50ng-50mg percutaneously a day for a human adult. In animals, the drugs may be administered according to the human dosage (1/60 per kg body wt.).
                                                                                                           The sequence encodes tumor necrosis factor which is an a agent and a lymphokine. This sequence is the same as th AAP70557 but has 16 extra amino acids at the N-terminal.

THE STRUCTION: Cytckine that binds to TMFRSFIA/TMFR1 and

TMRRSFIB/TMFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and 1s implicated in the induction of cachexia, Under certain conditions it can stimulate cell

THE STRUCTION OF THE STRUCTURE OF 
                                                                                                                                                        :-

                                                                                                                    proliferation and induce cell differentiation.
SUBGUNIT: Homotrimer (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
PTM: The soluble form derives from the membrane form by
                                                             proteclytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form occurs by binding to soluble TNFRSF1A/TNFR1
                                          Similarity)
DISEASE: CA
                                                        PTM: The membrane form, but membrane form, but phosphorylated on serine residues.
                                                                                                                                                                                        pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction cachezia, Under certain conditions it can stimulate cell

        "Porcine tumor necrosis factor alpha: cloning with the polymerase chain reaction and determination of the nucleotide sequence."; Gene 81:185-191(1989).

-i- FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNFRSF1B/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

C -i- SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNFRSF1B/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation (By similarity).

-!- SUBCHLIULAR LOCATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).

-!- PTM: The soluble form (By similarity).

-!- PTM: The soluble form (By similarity).

-!- PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSF1A/TNFR1 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                MOD_RES

It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin I secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBGUNIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY

"High resolution crystal structure of a human tumor necrosis factor-
alpha mutant with low systemic toxicity.";
J. Biol. Chem. 273:2153-2160(1998).

-I- FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and
TNFRSF1B/TNFBR. It is mainly secreted by macrophages and can
induce cell death of certain tumor cell lines. It is potent
                                                                                                                                                                                            the

SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DISEASE: CACHEXIA ACCC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteolytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSFIA/TNFRI (1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNFRSF1B/TNFBR. It is mainly secreted by macrophages and car induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of the control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBUNIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                              proteolytic processing (By similarity).
PTM: The membrane form, but not the soluble form,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNFRSF1B/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent
                                                                                                                                                                                                                                                                                                                                  SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY.

                                                                                                                                                                                                                                                  proliferation and induce cell differentiation.
SUBUNIT: Homotrimer (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein. Al
extracellular soluble form (By similarity).
PTM: The soluble form derives from the membrane fo
proteolytic processing (By similarity).
PTM: The membrane form, but not the soluble form,
                                          SWISS-PROT entry is copyright. It is produced through a collaboration the Swiss Institute of Bioinformatics and the EMBL outstation een the Swiss Institute. There are no restrictions on it
                                                                                                                                                                                                            phosphorylated on serine residues. Dephosphorylation of the membrane form ocurrs by binding to soluble TNFRSF1A/TNFR1 (
                                                                                                                                                                                                                                                                                                                                                                                                        pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachesia, Under certain conditions it can stimulate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RETPEGAEAKPWY 191

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 KDTPEGAELKPWY
                                         SUBUNIT: Homotrimer (By similarity).
SUBCELULAR LOCATION: Type II membrane protein.
extracellular soluble form (By similarity).
PTM: The soluble form derives from the membrane proteolytic processing (By similarity).
PTM: The membrane form, but not the soluble form
                                                                                                                                                                                                                                                                   . Immunol. Immunopathol. 82:183-192(2001). FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNFRSF1B/TNFBR. It is mainly secreted by macrophages induce cell death of certain tumor cell lines. It is
                                                                                                                                                                           pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation (By similarity)
  membrane form ocurrs by binding
                           phosphorylated on serine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         X62141; CAA44068.1;
